Abstract

According to the EU directives and the state law, Poland as an EU member is obliged to the vast limitation of the quantity of storage communal waste. The fulfilling those obligations is available only on the way of scientific research in searching new treatment methods which give the products useful for another user and will be accepted on economical aspect. For the disposal of mixed communal wastes among the others, the installations for mechanical and biological treatment can be taken into consideration for

substances biodegradable and typical biological methods for extracted biomass. The paper presents requirements related to the treatment products and assessments of possibility in the receiving of its suitable properties.
